

Characterising the set of (untruncated) signature

Horatio Boedihardjo

University of Warwick

July 10, 2020

The starting point...

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Hambly, B. and Lyons, T., 2010. Uniqueness for the signature of a path of bounded variation and the reduced path group. *Annals of Mathematics*, pp.109-167.

Paths with concatenation

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition (Paths)

The set of paths:

$$P = \left\{ x : [0, 1] \rightarrow \mathbb{R}^d : x \text{ continuous}, x(0) = 0 \right\}.$$

Paths with concatenation

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition (Paths)

The set of paths:

$$P = \left\{ x : [0, 1] \rightarrow \mathbb{R}^d : x \text{ continuous, } x(0) = 0 \right\}.$$

Definition (Concatenation)

Given $x, y \in P$, define

$$(xy)(t) = \begin{cases} x(2t), & t \in [0, \frac{1}{2}]; \\ x(1) + y(2t - 1), & t \in [\frac{1}{2}, 1]. \end{cases}$$

Paths with concatenation

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition (Paths)

The set of paths:

$$P = \left\{ x : [0, 1] \rightarrow \mathbb{R}^d : x \text{ continuous, } x(0) = 0 \right\}.$$

Definition (Concatenation)

Given $x, y \in P$, define

$$(xy)(t) = \begin{cases} x(2t), & t \in [0, \frac{1}{2}]; \\ x(1) + y(2t - 1), & t \in [\frac{1}{2}, 1]. \end{cases}$$

Goal:

Turn $(P,)$ into a group.

Definition of a group

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition

Recall $(G, *)$ is a group if

1. (Closure)

$$x * y \in G \quad \forall x, y \in G;$$

2. (Associativity)

$$(x * y) * z = x * (y * z), \quad \forall x, y, z \in G.$$

3. (Identity)

$$\exists e \in G \quad x * e = e * x = x \quad \forall x \in G.$$

4. (Inverse)

$$\forall x \in G \quad \exists y \in G \quad x * y = e$$

No inverse

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Fact

*Path almost never have inverse wrt concatenation.
Identity element:*

$$e(t) = 0 \quad \forall t \in [0, 1].$$

Candidate for inverse:

$$\overleftarrow{x}(t) = x(1 - t) - x(1).$$

Then

$$(x \overleftarrow{x})(t) = \begin{cases} x(2t), & t \in [0, \frac{1}{2}]; \\ x(2 - 2t), & t \in [\frac{1}{2}, 1]. \end{cases}$$

Unless $x = e$,

$$x \overleftarrow{x} \neq e.$$

No inverse

Characterising
the set of
(untruncated)
signature

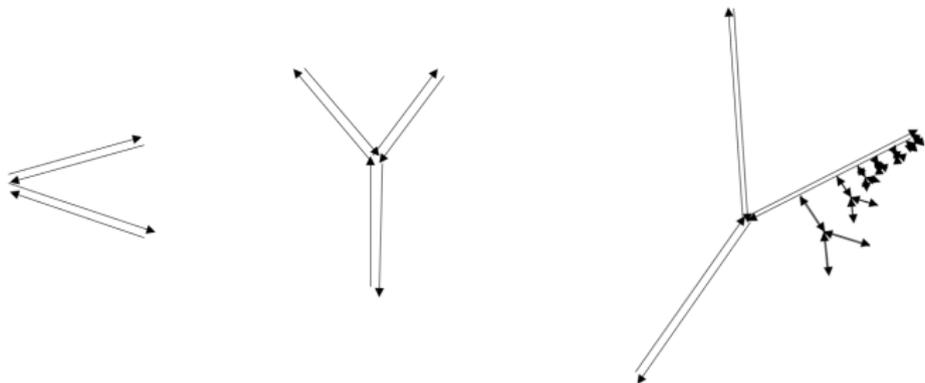

Horatio
Boedihardjo

Need an equivalence relation \sim on P such that:

1

$$x \overleftarrow{x} \sim \overleftarrow{x} x \sim e$$

All of the followings are $\sim e$:

No inverse

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Need an equivalence relation \sim on P such that:

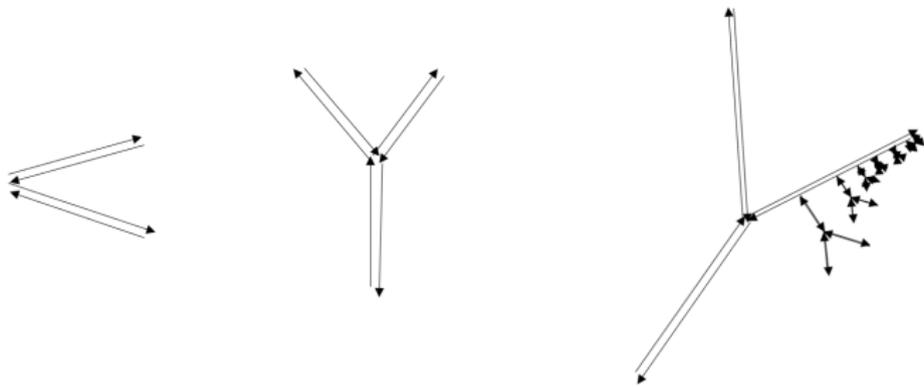

1

$$x \overleftarrow{x} \sim \overleftarrow{x} x \sim e$$

2

$$x_1 \sim x_2, y_1 \sim y_2 \implies x_1 y_1 \sim x_2 y_2.$$

All of the followings are $\sim e$:

Tree-like path

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

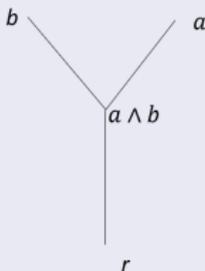

Definition (\mathbb{R} -tree, Favre-Jonsson04)

If τ is a partially ordered set satisfying:

1. τ has global min. (call r) and pairwise min.
2. For any $t \in \tau$, the set below is totally ordered

$$\{s \in \tau : s \preceq t\};$$

3. $\exists L : \tau \rightarrow \mathbb{R}_{\geq 0}$ map intervals in τ bijectively to intervals in \mathbb{R} .
If $d(s, t) = L(t) + L(s) - 2L(s \wedge t)$,
then (τ, d) is a \mathbb{R} -tree.

Tree-like path

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition (Loop in a tree)

Let τ be a \mathbb{R} -tree. A loop in τ is a continuous function $\phi : [0, 1] \rightarrow \tau$ such that $\phi(0) = \phi(1)$.

Tree-like path

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition (Loop in a tree)

Let τ be a \mathbb{R} -tree. A loop in τ is a continuous function $\phi : [0, 1] \rightarrow \tau$ such that $\phi(0) = \phi(1)$.

Definition (Tree-like Hambly-Lyons10)

A path $x : [0, 1] \rightarrow V$ is tree-like if there exists:

1. a loop ϕ in a \mathbb{R} -tree τ ;
2. a continuous function $\psi : \tau \rightarrow V$

$$x = \psi \circ \phi.$$

Tree-like equivalence

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition (Tree-like relation, Hambly-Lyons10)

We define a relation \sim on paths by $x_1 \sim x_2$ if

$x_1 \overleftarrow{x_2}$ is a tree-like path.

Tree-like equivalence

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition (Tree-like relation, Hambly-Lyons10)

We define a relation \sim on paths by $x_1 \sim x_2$ if

$x_1 \overleftarrow{x_2}$ is a tree-like path.

Theorem (Hambly-Lyons10)

*The relation \sim is an **equivalence** relation on the set of bounded variation paths.*

The set

$$RP = \left\{ [x]_{\sim} : x : [0, 1] \rightarrow \mathbb{R}^d \text{ continuous, } BV, x(0) = 0 \right\}$$

is called the (BV) Reduced path group.

Proof of Tree-like equivalence 1

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition (Signature)

The signature of $x : [0, 1] \rightarrow \mathbb{R}^d$ is defined by

$$S(x)_{0,1} = 1 + \int_0^1 dx_{t_1} + \dots + \int_{0 < t_1 < \dots < t_n < 1} dx_{t_1} \otimes \dots \otimes dx_{t_n} + \dots$$

Proof of Tree-like equivalence 1

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition (Signature)

The signature of $x : [0, 1] \rightarrow \mathbb{R}^d$ is defined by

$$S(x)_{0,1} = 1 + \int_0^1 dx_{t_1} + \dots + \int_{0 < t_1 < \dots < t_n < 1} dx_{t_1} \otimes \dots \otimes dx_{t_n} + \dots$$

Theorem (Hambly-Lyons10)

If x has bounded variation (BV),

$$S(x)_{0,1} = 1 \iff x \text{ is tree-like.}$$

Proof of Tree-like equivalence 1

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition (Signature)

The signature of $x : [0, 1] \rightarrow \mathbb{R}^d$ is defined by

$$S(x)_{0,1} = 1 + \int_0^1 dx_{t_1} + \dots + \int_{0 < t_1 < \dots < t_n < 1} dx_{t_1} \otimes \dots \otimes dx_{t_n} + \dots$$

Theorem (Hambly-Lyons10)

If x has bounded variation (BV),

$$S(x)_{0,1} = 1 \iff x \text{ is tree-like.}$$

Corollary

$x_1 \sim x_2 \iff S(x_1)_{0,1} = S(x_2)_{0,1}$ for BV paths.

Reduced paths

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition (Reduced paths)

A path $x : [0, 1] \rightarrow \mathbb{R}^d$ is **reduced** if

$$\text{length}(x) = \inf \left\{ \text{length}(\alpha) : S(\alpha)_{0,1} = S(x)_{0,1} \right\}.$$

Reduced paths

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition (Reduced paths)

A path $x : [0, 1] \rightarrow \mathbb{R}^d$ is **reduced** if

$$\text{length}(x) = \inf \left\{ \text{length}(\alpha) : S(\alpha)_{0,1} = S(x)_{0,1} \right\}.$$

Corollary (Hambly-Lyons10)

If x_1, x_2 are reduced paths with bounded variation,

$$S(x_1)_{0,1} = S(x_2)_{0,1} \iff x_1 = x_2 \text{ up to translation, reparam.}$$

Proof of uniqueness

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition

Let $Sh(n, k)$ be the set of bijections
 $\sigma : \{1, \dots, n+k\} \rightarrow \{1, \dots, n+k\}$ such that

$$\begin{aligned}\sigma(1) &< \sigma(2) < \dots < \sigma(n) \\ \sigma(n+1) &< \dots < \sigma(n+k).\end{aligned}$$

Proof of uniqueness

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Definition

Let $Sh(n, k)$ be the set of bijections
 $\sigma : \{1, \dots, n+k\} \rightarrow \{1, \dots, n+k\}$ such that

$$\begin{aligned}\sigma(1) &< \sigma(2) < \dots < \sigma(n) \\ \sigma(n+1) &< \dots < \sigma(n+k).\end{aligned}$$

Lemma ("Shuffle product formula")

If $x = (x^1, \dots, x^d)$,

$$\begin{aligned}& \int_{0 < t_1 < \dots < t_n < t} dx_{t_1}^{i_1} \dots dx_{t_n}^{i_n} \cdot \int_{0 < t_1 < \dots < t_k < t} dx_{t_1}^{i_{n+1}} \dots dx_{t_k}^{i_{n+k}} \\ &= \sum_{\sigma \in Sh(n, k)} \int_{0 < t_1 < \dots < t_{n+k} < t} dx_{t_1}^{i_{\sigma^{-1}(1)}} \dots dx_{t_{n+k}}^{i_{\sigma^{-1}(n+k)}}.\end{aligned}$$

Linear functionals on signatures

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Examples

Closure under products

$$\left(\int_{0 < t_1 < t_2 < t} dx_{t_1}^1 dx_{t_2}^2 \right) \left(\int_{0 < t_1 < t} dx_{t_1}^1 \right) \\ = 2 \int_{0 < t_1 < t_2 < t_3 < t} dx_{t_1}^1 dx_{t_2}^1 dx_{t_3}^2 + \int_{0 < t_1 < t_2 < t_3 < t} dx_{t_1}^1 dx_{t_2}^2 dx_{t_3}^1.$$

Closure under integration

$$\int_0^t \left(\int_{0 < t_1 < t_2 < u} dx_{t_1}^1 dx_{t_2}^2 + \int_{0 < t_1 < u} dx_{t_1}^1 \right) dx_u^2 \\ = \int_{0 < t_1 < t_2 < t_3 < u} dx_{t_1}^1 dx_{t_2}^2 dx_{t_3}^2 + \int_{0 < t_1 < t_2 < u} dx_{t_1}^1 dx_{t_2}^2.$$

Proof

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Lemma (B. Geng Lyons Yang 16)

If $t \rightarrow S(x)_{0,t}$ and $t \rightarrow S(y)_{0,t}$ both injective.

If x not reparametrisation of y , then

\exists smooth functions L_1, L_2

$$\int_0^1 L_1(S(x)_{0,u}) dL_2(S(x)_{0,u}) \neq \int_0^1 L_1(S(y)_{0,u}) dL_2(S(y)_{0,u})$$

Proof

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Lemma (B. Geng Lyons Yang 16)

If $t \rightarrow S(x)_{0,t}$ and $t \rightarrow S(y)_{0,t}$ both injective.

If x not reparametrisation of y , then

\exists smooth functions L_1, L_2

$$\int_0^1 L_1(S(x)_{0,u}) dL_2(S(x)_{0,u}) \neq \int_0^1 L_1(S(y)_{0,u}) dL_2(S(y)_{0,u})$$

Corollary

If $t \rightarrow S(x)_{0,t}$ and $t \rightarrow S(y)_{0,t}$ injective, then

$$S(x)_{0,1} = S(y)_{0,1} \iff x \text{ reparametrisation of } y.$$

Isometry

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Theorem (Hambly-Lyons isometry)

A path $x : [0, 1] \rightarrow \mathbb{R}^d$ satisfies $\|x'_t\| = 1 \forall t$ and is C^3 , then

$$\text{length}(x) = \limsup_{n \rightarrow \infty} \left\| n! \int_{0 < t_1 < \dots < t_n < 1} dx_{t_1} \otimes \dots \otimes dx_{t_n} \right\|^{\frac{1}{n}}, \quad (1)$$

where $\|\cdot\|$ is the projective norm w.r.t. Euclidean norm.

Isometry

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Theorem (Hambly-Lyons isometry)

A path $x : [0, 1] \rightarrow \mathbb{R}^d$ satisfies $\|x'_t\| = 1 \forall t$ and is C^3 , then

$$\text{length}(x) = \limsup_{n \rightarrow \infty} \left\| n! \int_{0 < t_1 < \dots < t_n < 1} dx_{t_1} \otimes \dots \otimes dx_{t_n} \right\|^{\frac{1}{n}}, \quad (1)$$

where $\|\cdot\|$ is the projective norm w.r.t. Euclidean norm.

Open problem

1. Is lim sup in (1) in fact a lim?
2. Extend isometry (1) to reduced bounded variation paths.

lim = lim sup

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Theorem (B.-Geng)

If x is a non tree-like, B.V. path, then there is at most finitely many n such that

$$\int_{0 < t_1 < \dots < t_n < 1} dx_{t_1} \otimes \dots \otimes dx_{t_n} = 0.$$

lim = lim sup

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Theorem (B.-Geng)

If x is a non tree-like, B.V. path, then there is at most finitely many n such that

$$\int_{0 < t_1 < \dots < t_n < 1} dx_{t_1} \otimes \dots \otimes dx_{t_n} = 0.$$

Theorem (Chang-Lyons-Ni)

If x is a B.V. path, then the following limit exists:

$$\lim_{n \rightarrow \infty} \left\| n! \int_{0 < t_1 < \dots < t_n < 1} dx_{t_1} \otimes \dots \otimes dx_{t_n} \right\|^{\frac{1}{n}}.$$

lim = lim sup

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Ideas from Chang-Lyons-Ni.

If $x = (x^1, \dots, x^d)$,

$$\begin{aligned} & \int_{0 < t_1 < \dots < t_n < t} dx_{t_1}^{i_1} \dots dx_{t_n}^{i_n} \cdot \int_{0 < t_1 < \dots < t_k < t} dx_{t_1}^{i_{n+1}} \dots dx_{t_k}^{i_{n+k}} \\ &= \sum_{\sigma \in Sh(n, k)} \int_{0 < t_1 < \dots < t_{n+k} < t} dx_{t_1}^{i_{\sigma^{-1}(1)}} \dots dx_{t_{n+k}}^{i_{\sigma^{-1}(n+k)}}. \end{aligned}$$

Therefore,

$$\begin{aligned} & \left| \int_{0 < t_1 < \dots < t_n < t} dx_{t_1}^{i_1} \dots dx_{t_n}^{i_n} \right| \cdot \left| \int_{0 < t_1 < \dots < t_k < t} dx_{t_1}^{i_{n+1}} \dots dx_{t_k}^{i_{n+k}} \right| \\ & \leq |Sh(n, k)| \max_{\sigma \in Sh(n, k)} \left| \int_{0 < t_1 < \dots < t_{n+k} < t} dx_{t_1}^{i_{\sigma^{-1}(1)}} \dots dx_{t_{n+k}}^{i_{\sigma^{-1}(n+k)}} \right|. \end{aligned}$$

Proof of isometry (special case)

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Lemma (Hambly-Lyons10)

Let Y_t^λ be the solution to

$$dY_t^\lambda = \lambda A(dx_t) Y_t^\lambda, \quad Y_0^\lambda = v,$$

with $\|v\| = 1$. If $\|A\|_{\mathbb{R}^d \rightarrow L(\mathbb{R}^n, \mathbb{R}^n)} = 1$, then

$$\limsup_{\lambda \rightarrow \infty} \frac{\log \|Y_1^\lambda\|}{\lambda} \leq \lim_{n \rightarrow \infty} \left\| n! \int_{0 < t_1 < \dots < t_n < 1} dx_{t_1} \otimes \dots \otimes dx_{t_n} \right\|^{\frac{1}{n}}.$$

Proof of isometry (special case)

Characterising
the set of
(untruncated)
signature

Horatio
Boedihardjo

Lemma (Hambly-Lyons10)

Let Y_t^λ be the solution to

$$dY_t^\lambda = \lambda A(dx_t) Y_t^\lambda, \quad Y_0^\lambda = v,$$

with $\|v\| = 1$. If $\|A\|_{\mathbb{R}^d \rightarrow L(\mathbb{R}^n, \mathbb{R}^n)} = 1$, then

$$\limsup_{\lambda \rightarrow \infty} \frac{\log \|Y_1^\lambda\|}{\lambda} \leq \lim_{n \rightarrow \infty} \left\| n! \int_{0 < t_1 < \dots < t_n < 1} dx_{t_1} \otimes \dots \otimes dx_{t_n} \right\|^{\frac{1}{n}}.$$

■

$$Y_1^\lambda = v + \dots + \lambda^n \int_{0 < t_1 < \dots < t_n < 1} \text{Ad}x_{t_1} \dots \text{Ad}x_{t_n} v \dots$$

Isometry

Characterising
the set of
(untruncated)
signature
